Photoshop is an all-in-one professional image editing suite for graphic design, web design, video editing and digital photography. These are the must-know Photoshop features for a design and photography professional. 5 Photoshop Features you Need to Know 1. Separate Work Area Designers or photo editors can move the editing space in Photoshop with the mouse, as they see fit. As an alternative, you can also use the keyboard. First, click the move tool, then click and hold the icon of the tool and then drag it to the right or left, depending on your preference. The movement of the tool is mapped to four directions: up, down, right, and left. 2. Layers Layers are essential to Photoshop. These are the visual building blocks of digital art. You can easily change the color of each layer and its opacity by clicking on each respective layer to select or de-select it. Layers give you the freedom to edit each area or portion of an image independently to create custom edits of an image. 3. Clone Stamp The Clone Stamp tool can be used to copy the pixels of an object, such as the original image, back onto a layer. This tool is also known as the healing tool and the fill tool. It is important to learn how to use the clone tool because it is the most frequently used tool in Photoshop. 4. Pen Tool The pen tool is one of the most frequently used tools in Photoshop. Photoshop designers use it for special effects, and photo editors use it to create high-resolution, high-quality photos and images. This tool contains predefined tools such as, lines, ellipses, rectangles and circles. 5. Eraser This is the most commonly used tool in Photoshop. It allows you to remove portions of the original image. Its function is the opposite of the clone tool because it lets you remove portions of a new image instead of copying it from the original image. 6. Paint Bucket The paint bucket tool allows you to select a specific area of an image, remove the selected area, and replace it with a different color. This tool is highly useful when you want to change the color of the entire image. You can select different colors by using the different keys on your keyboard. For example, the "K" key is for black, "Y" is for yellow, and so on. 7 05a79cecff

Q: Can't bind to property 'child' in component 'atc:passwordComponent' because it is not a known property of element I am trying to handle the submit button in Angular 2+ (upgraded from v 1.5.5). I am trying to follow this answer, but it looks like there is a newer way to handle the submit. From my understanding, the error is saying that it can't find the child element, but I am able to dynamically create the html. Here is the html that it is searching for: Save Here is my component that is being called:

```
import { Component, Input, OnChanges, SimpleChange, AfterViewInit, ElementRef } from '@angular/core'; @Component({ selector: 'password-component', templateUrl: './password-component.component.html' }) export class PasswordComponent implements OnChanges { @Input() member: Member; constructor(private el: ElementRef) { ngOnChanges() { this.render(); } saveMember(member) { alert('Saving Member!'); } render() { console.log(this.member.password); // e.nativeElement.innerHTML = this.member.password; } } Here is my parent class that is creating the component: import { Component } from '@angular/core'; import { Data } from './data'; import { Model } from './model'; @Component({ selector: 'atc', template: 'Select a Member Or

Q: How to understand the "residue theorem"? Could someone suggest some books to understand the residue theorem (it's never been in a math course)? What I've found so far is that the residue theorem is the complex analytic continuation of the fact that the integral of an absolutely convergent series is equal to the sum of the integrals of its terms. A: I would suggest Lang, Serge Complex Analysis. A: 1) So long as the integrals have no singularities in the interior of the fundamental domain, they are essentially unique. 2) Going from the circle to the line, one uses de l'Hospital's rule, which says that, if $f(z)$ and $g(z)$ are holomorphic in U and if $f(z) = O(1)$ and $g(z) = O(1)$ then $\int_{\gamma} f(z)g(z) dz = O(\int_{\gamma} 1) dz$. 3) Going from the line to the circle, one uses Cauchy's theorem, which says that $\int_{\gamma} f(z) dz = 0$ if $f(z)$ has a simple pole at $z = \zeta$. Hence if $f(z)$ has a simple pole at ζ , we have $\int_{\gamma} f(z) dz = \int_{\gamma} \frac{a}{z - \zeta} dz = \int_{\gamma} \frac{1}{z - \zeta} dz$ where γ is a path which goes from $a + i\infty$ to ζ along the negative real axis, then back along the positive real axis to $a + i\infty$. This is precisely the residue of $f(z)$ at ζ , and hence (by linearity of the integral) the residue of $f(z)$.
